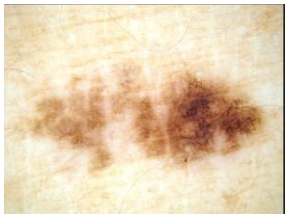
Table of contents

Introduction

- Skin cancer is one of the most common types of cancer.
- The main cause is UV light .
- Skin lesions can be benign, pre-cancerous or malignant .

Benign Cell Keratosis

Actinic Keratosis



Melanoma

Melanoma

- Melanoma cancer is less common than other skin cancer types, but it is the most dangerous one as it spreads fastly.
- Clinical accuracy for melanoma detection ranges from 65% to 80% due to interclass similarities in lesions.

Proposed Solution

- If skin cancer detected early, it can be treated effectively .
- When detected early, the 5-year survival rate for melanoma is 99%.
- The proposed solution developed a model that is capable of classifying and segmenting the skin region.

Skin lesions classification task

Melanoma semantic segmentation task

Impact

Improving Public Health

Reducing Treatment Costs

Reducing Psychological Burden

Requirements

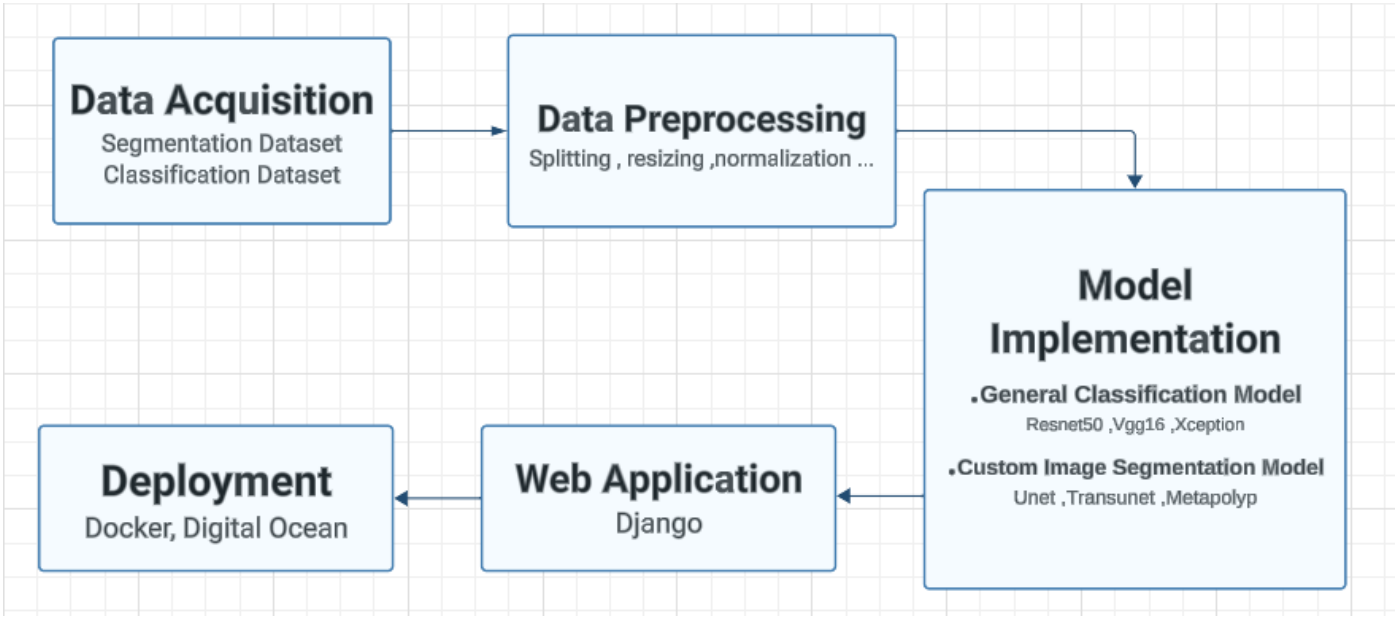
Functional Requirements

- Lesion Classification
- Melanoma Segmentation
- Image Upload

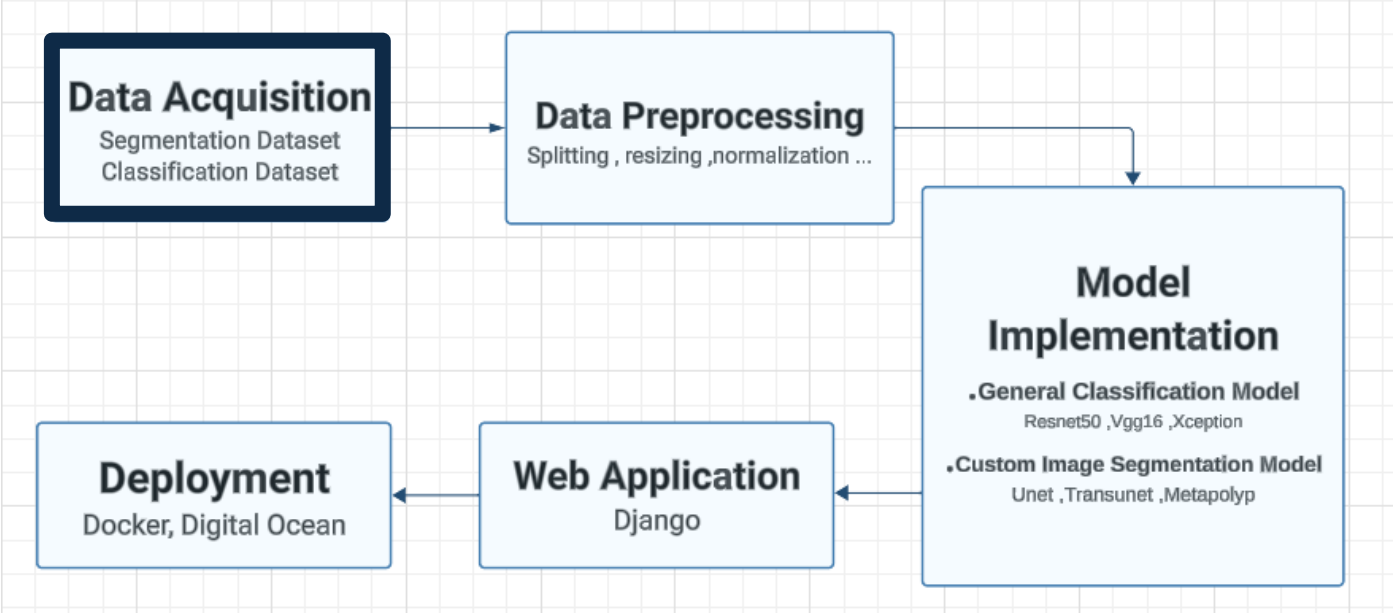
Non-Functional Requirements

- Performance
- Usability
- Reliability
- Maintainability
- User Friendly

Methodology

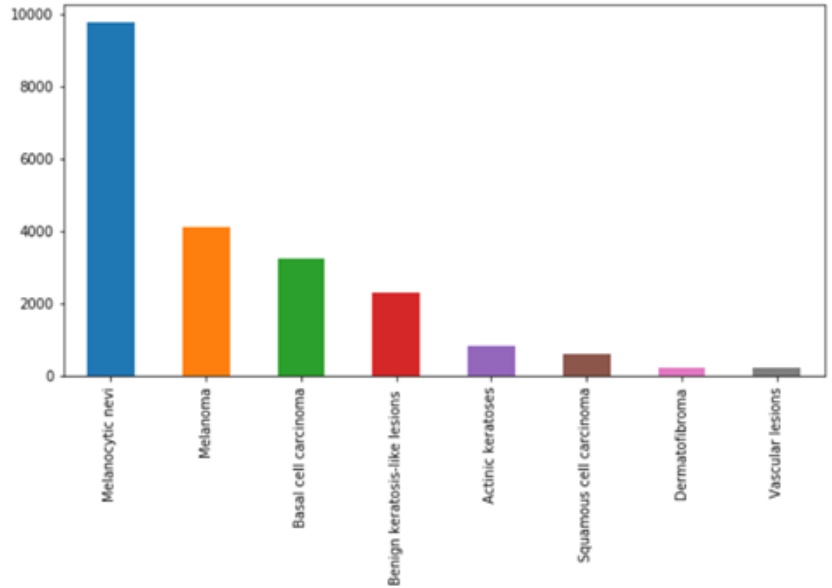


Data Acquisition



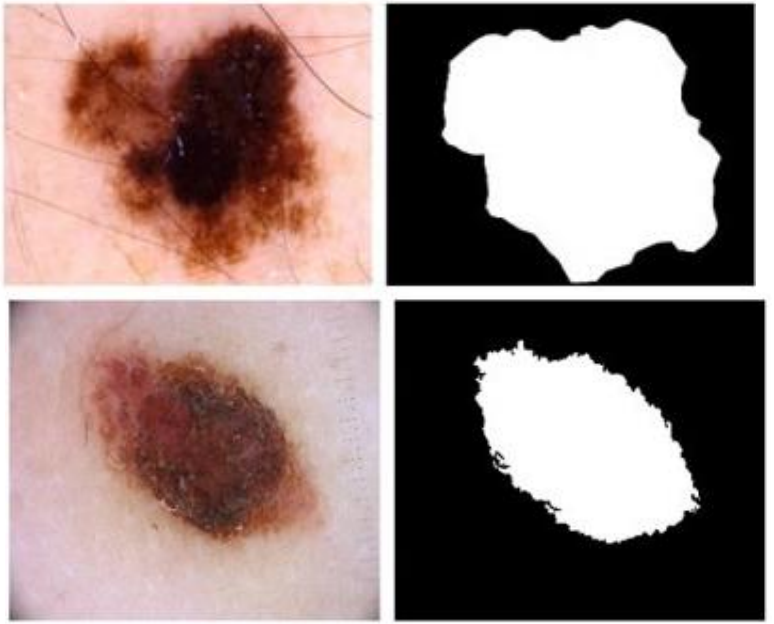
Skin Cancer Classification Dataset

The classification dataset is ISIC 2019 dataset that contains 25.331k images.
The dataset contains 8 types of Skin lesions



Melanoma Segmentation Dataset

The classification dataset is ISIC 2018 dataset It contains 2594 images and corresponding ground truth response masks



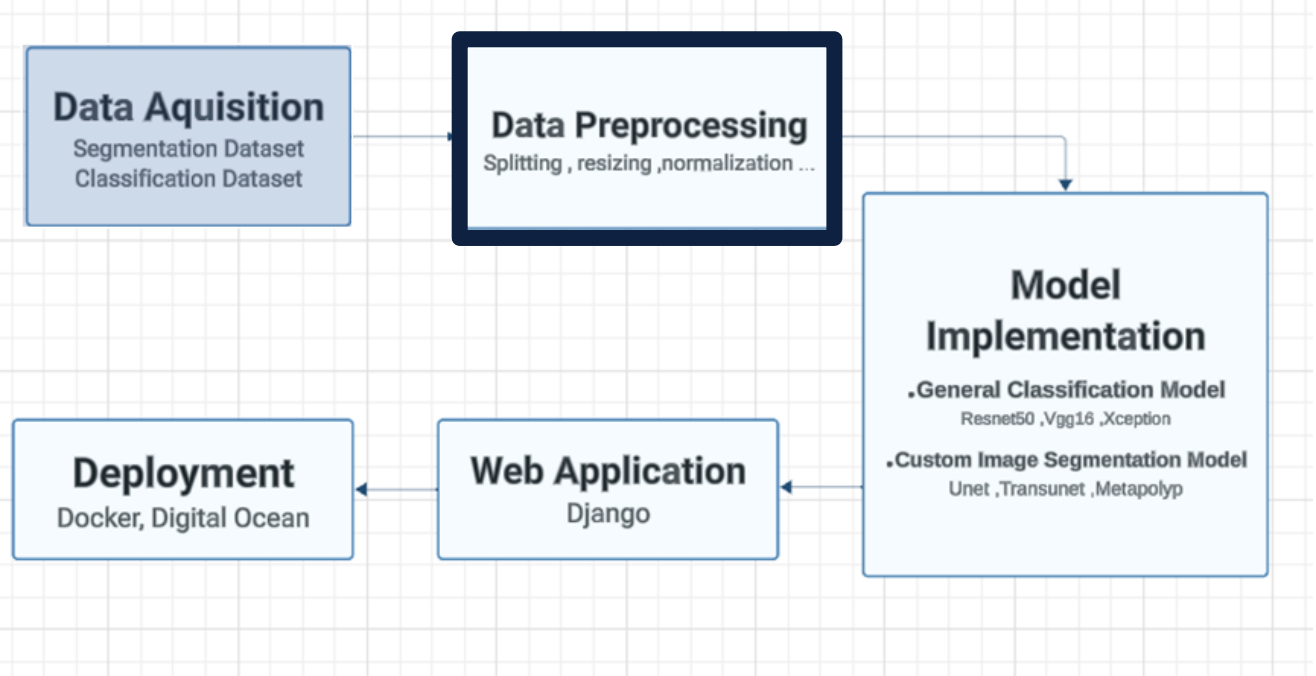
Semantic Segmentation

Input

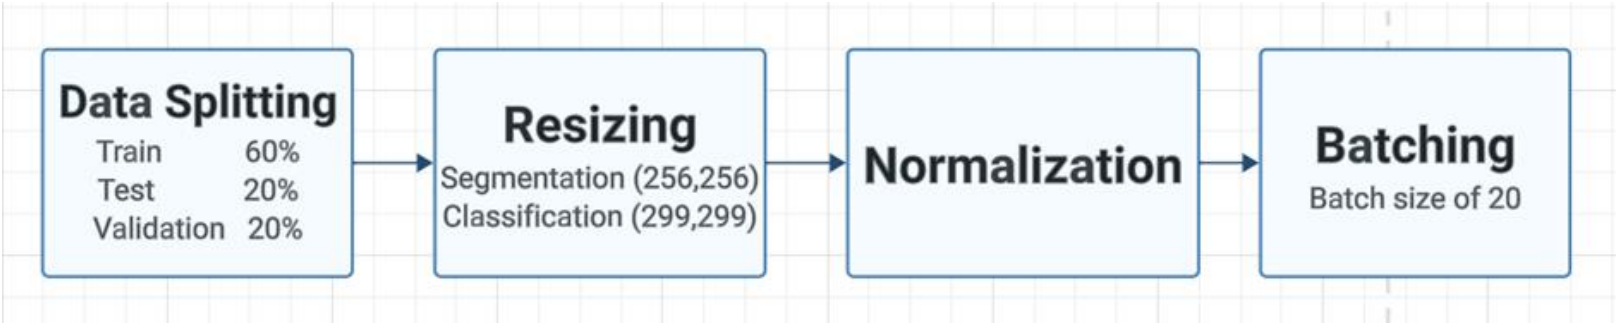
Segmentation [14]

Assigning a class to each pixel

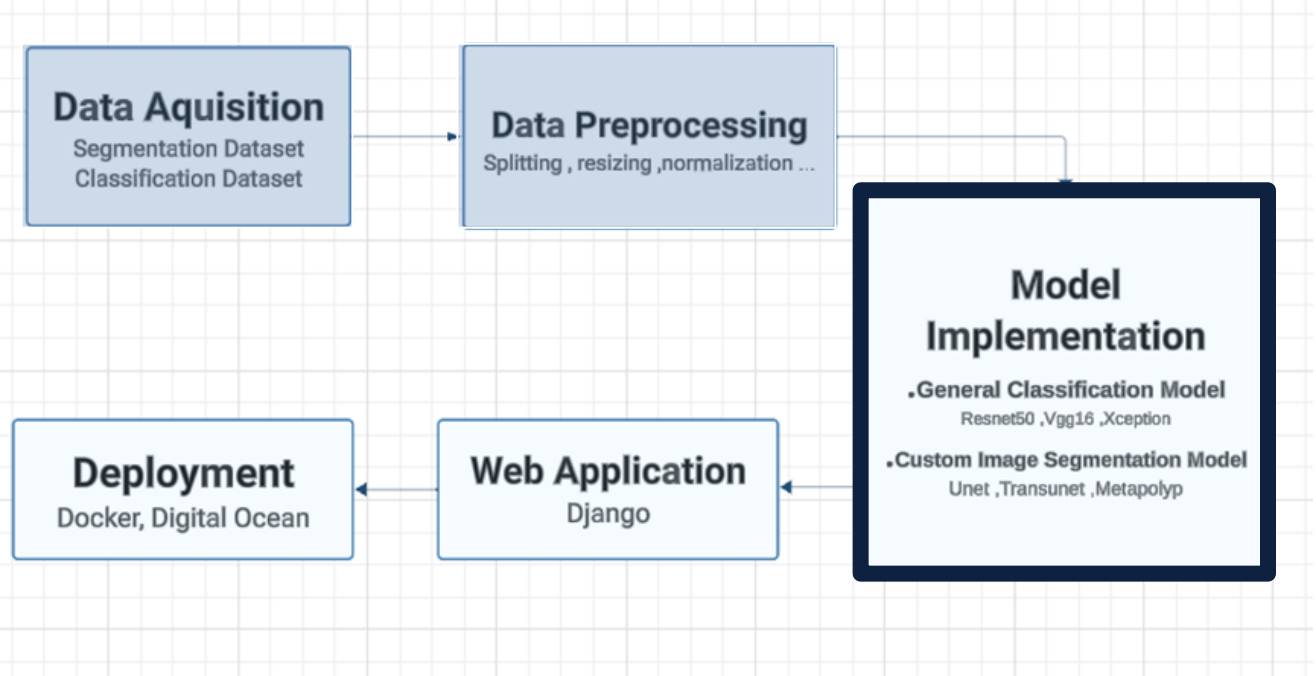
Data Preprocessing



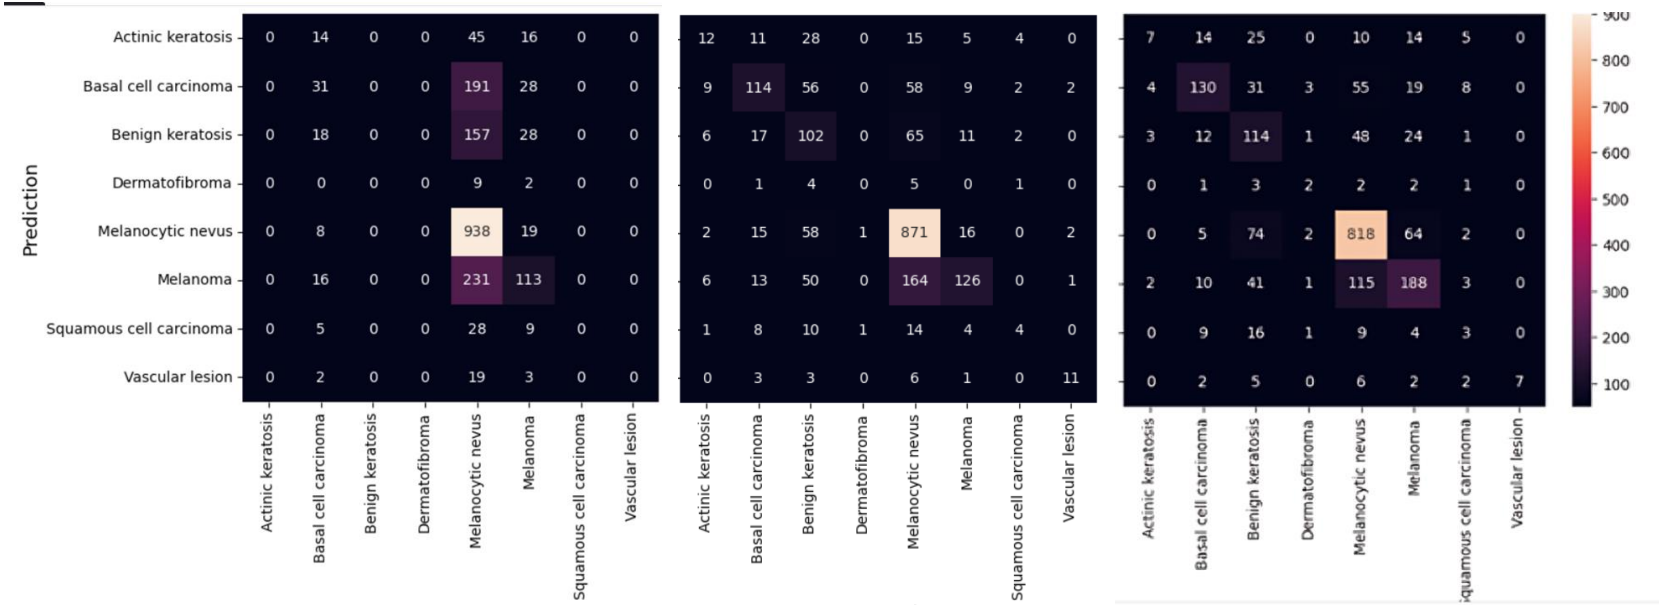
Data Preprocessing



Model Implementation



Classification Models



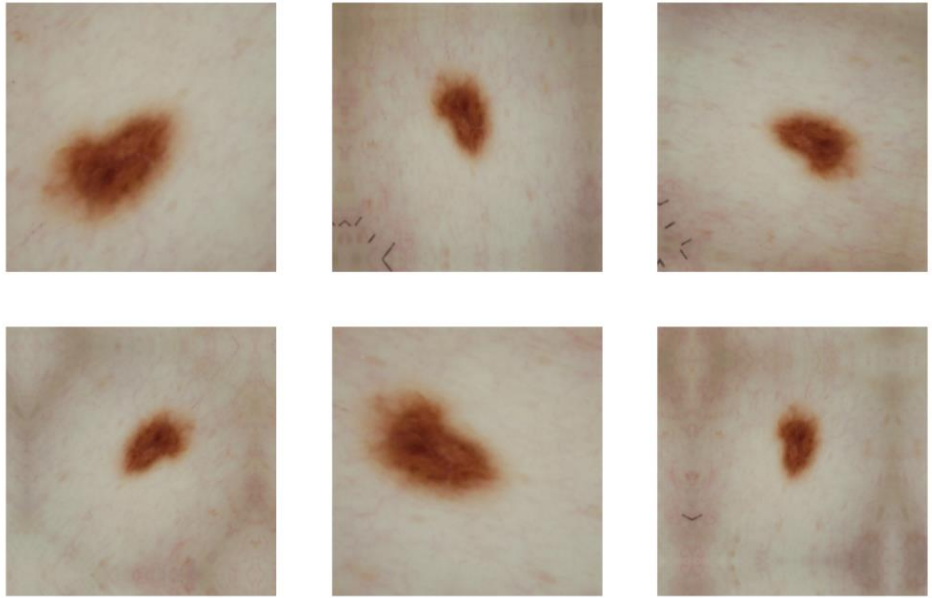
ResNet 50 VGG 16 Xception

Classification Model

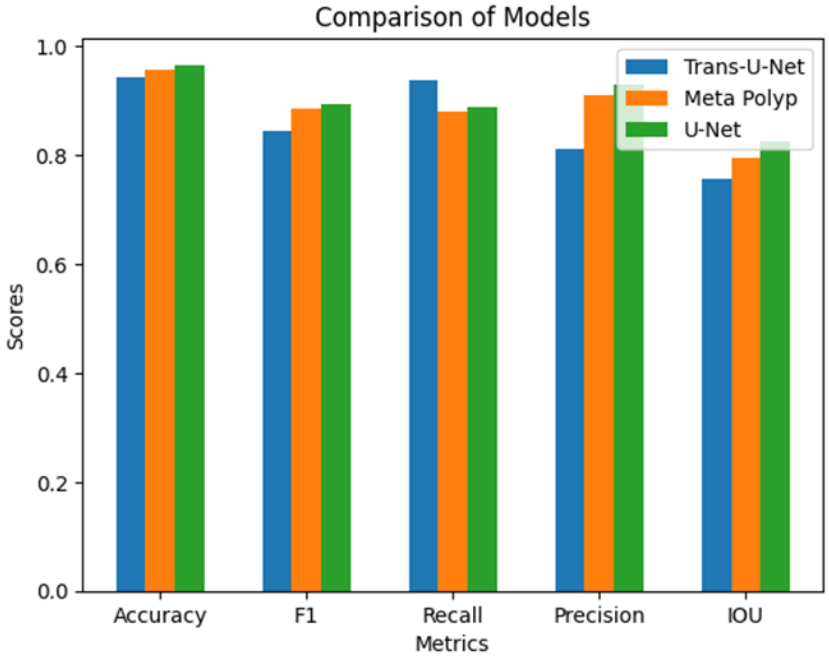
According to the results we selected Xception. We added a dropout layer with a dropout rate of 0.25, dense layer and augmentation layer

Loss	Categorical Accuracy	Top_2_Accuracy	Top_3_Accuracy
33%	89.5%	97.3%	99.3%

Augmentation layer

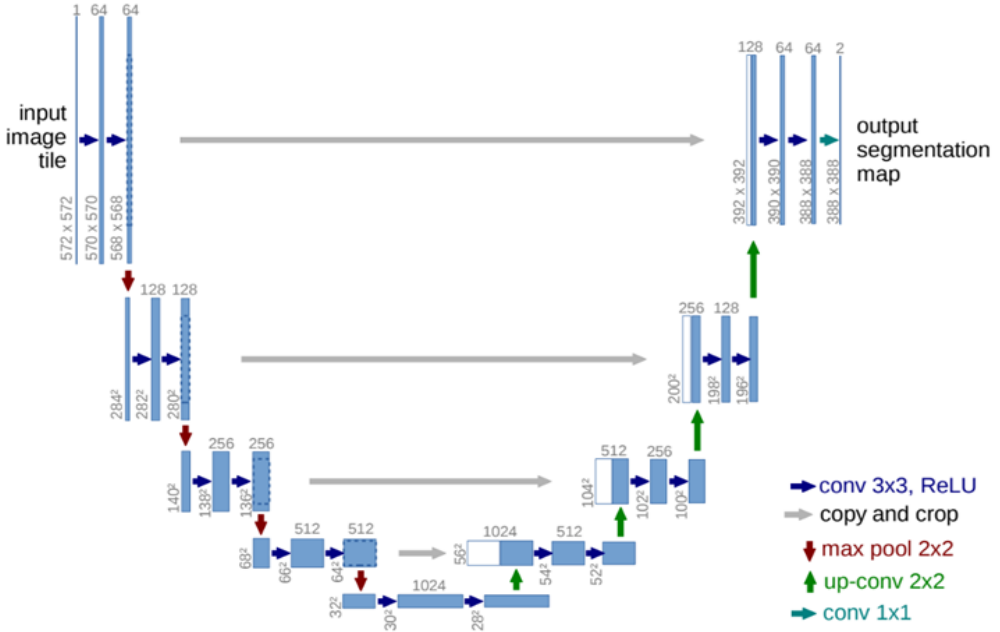


Segmentation Models



Segmentation Models

According to the results we selected U-Net. Then we tried to enhance the results so we added two encoder decoder layers



Results of U-Net

Accuracy	F1	IOU	Recall	Precision
0.965	0.894	0.83	0.887	0.929

Future Work

"Ask a doctor" Feature — Collaboration with domain experts so users gain the invaluable opportunity to seek advice and validation from healthcare professionals.

Mobile Application — The development of a mobile application enhanced accessibility.

Feedback Mechanism — Users provide information on the accuracy of their reports that enable users to contribute to the system's improvement over time.

Online Database — For securely storing patient records serves a dual purpose. To establish a foundation for sharing information exclusively with dermatologists.
